## **Acknowledgements**

This project was completed with the cooperation and support of numerous medical interpreters throughout the United States. PSI Services LLC, Language Line Academy, and The National Board extend our appreciation to the many individuals who completed job analysis surveys and participated in assessment sessions. In addition, special thanks are extended to the State of Oregon Health Authority, Office of Equity and Inclusion, for their crucial role in the funding of this project through a grant received by The National Board.

Language Line Academy staff, Danyune Geertsen, Director, Language Line Academy and Janet Erickson-Johnson, Language Line Academy Director of Interpreter Certification, were instrumental in the completion of the development of the oral examination. The successful completion of this project would not have been possible without their continued effort and support.

PSI project staff included John Weiner, Project Director, and Monica Elcott, Project Consultant.

## **Executive Summary**

This report describes the methodology and results of a project conducted jointly by Language Line Academy (LLU), an affiliate of Language Line Services, The National Board, and PSI Services LLC (PSI) to construct a series of oral examinations for medical interpreter certification in the languages of Mandarin, Russian, Cantonese, Korean, and Vietnamese. The test development methodology was modeled after a previous research and development project conducted for a Spanish language oral examination (*Development and Validation of an Oral Examination for Medical Interpreter Certification: Technical Report*, PSI, February 2010).

The present report documents the process of exam development, pilot testing and psychometric analysis and assembly of equivalent alternate forms of each language exam. The report describes psychometric characteristics of the resulting examinations, along with future analyses planned after the examinations are implemented to ensure acceptable measurement quality. The test development and validation methodology was designed to comport with the *Standards for Educational and Psychological Testing* (AERA, APA, NCME, 1999), as well as the *Standards for the Accreditation of Certification Programs* (National Commission for Certifying Agencies, 2010).

### **Test Design**

Specifications for the examinations were founded upon a national job analysis of the medical interpreter profession (PSI, Feb. 2010). The exam content outlines specified topics, subtopics and their relative weights in constructing the examinations.

### **Item Development**

PSI conducted intensive item writing and standard setting training sessions with LLU staff. Each test design subject matter expert received the training according to the specifications and guidelines provided by PSI. Test item development for the five language exams occurred between March and May 2011 and entailed extensive review, discussions, and revisions. In addition, a scoring dictionary was developed for rating purposes as part of this process.

### **Pilot Administration**

Two experimental versions were assembled for each of the Russian, Mandarin, Cantonese, Korean, and Vietnamese oral examinations. These forms were pilot tested in a series of experimental test administrations that took place between June 2011 and April 2013. The pilot samples ranged in size from 30 to 32 experienced medical interpreters per language exam.

### **Evaluator Training and Calibration**

The oral examinations are reviewed and scored by expert interpreters in each language, who received extensive training and calibration in using the scoring rubric prior to scoring the pilot examinations.

### **Test Form Construction**

Statistical analyses were conducted on the pilot test data to ensure that the items demonstrated acceptable psychometric properties and to assemble equivalent alternate exam forms. Final forms of the new oral exams were assembled based on the examination content specifications outlined in the aforementioned technical report (PSI, 2010), as well as the statistical analysis from the pilot test data, resulting in three equivalent alternate forms for each language.

## **Standard Setting**

Recommended minimum passing scores (cut scores) were established through a standard setting study for each of the oral exams. Subject matter experts rated each item using a modified Angoff procedure. PSI staff then conducted analyses of the Angoff ratings and pilot data identify a recommended cut score for each language exams, designed to ensure safe and competent practice as a medical interpreter.

## **Conclusion**

Overall, this report presents substantive evidence supporting the psychometric quality and validity of the Mandarin, Russian, Cantonese, Korean, and Vietnamese oral examinations for medical interpreter certification. The exams are founded upon a nationally representative occupational analysis survey, subject matter expert-developed test items and linkage to the job analysis, pilot testing and statistical analysis, and empirically-based test form assembly.

## **Introduction**

This document describes the methodology used to develop and validate a series of oral examinations for medical interpreter certification in the Russian, Mandarin, Cantonese, Korean, and Vietnamese languages. The overarching aim was to ensure that the exams measure the most current knowledge and skills considered essential to a certified medical interpreter's performance of services in a manner that ensures patient safety. The test development methodology was modeled after a previous research and development project conducted for a Spanish language oral examination (*Development and Validation of an Oral Examination for Medical Interpreter Certification: Technical Report*, PSI, February 2010).

The current exam development initiative took place between June 2011 and October 2013, and consisted of several key steps, including: (1) test item development in accordance with exam specifications based on prior job analysis; (2) item review and evaluation; (3) pilot testing; (4) standard setting; and (5) test form assembly. Each step of the test development and validation process is described in this technical report. These steps combine to provide evidence of psychometric quality and validity, helping to ensure that those who pass the national certification oral examination are qualified to practice in a manner that protects patient safety.

Highlights of the present report include the following:

- A technical overview of the procedures followed to review the medical interpreter oral examination item banks and assemble test forms in alignment with the previously-defined content and statistical specifications.
- A summary of the technical properties of the medical interpreter oral examinations, including the recommended minimum passing scores.

## **1. Item Development**

### **Item Writing Workshops**

PSI conducted comprehensive training sessions on item writing and standard setting procedures (modified Angoff) with LLU staff Janet Erickson-Johnson and Danyune Geertsen at PSI headquarters in January 2009. During the training, PSI psychometric staff provided various supporting materials, such as rating forms, procedural checklists, and PowerPoint presentations, so that LLU employees could conduct oral exam item development and review sessions with subject matter experts.

Further details regarding the item writing training session, participants, and procedures are given in separate technical reports for the written and oral exams (PSI, April 2010, *Development and Validation of Oral and Written Examinations for Medical Interpreter Certification: Technical Report*), and in a supplemental standard setting report (PSI, June 2012, *Addendum: Development and Validation of Oral and Written Examinations for Medical Interpreter Certification: Standard Setting Technical Report*).

### **Initial Exam Development Plan**

In consideration of the volume of examinations administered annually for the Russian, Mandarin, Cantonese, Korean, and Vietnamese languages (ranging from 50 to 100 oral exams in each language), it was determined that three (3) alternate test forms would be sufficient to develop for each language exam to maintain a reasonable degree of item exposure over a 4- or 5-year period.

### **Oral Exam Item Development**

LLU assembled teams of subject matter experts for each language, selecting individuals with extensive experience in the fields of medical interpreting, medical practice, and test design and development (see Appendix A). The subject matter experts received intensive training according to the specifications and guidelines provided by PSI. The training sessions covered PSI's *Item Reviewing and Writing Principles* and modified Angoff rating process.

The oral test design team completed the development of the test items in a sufficient quantity to be representative of a broad range of medical knowledge and to exceed the number of test items needed to create two distinct test forms. This process involved intensive work and review.

A standard scoring rubric was used across each of the language exams. The scoring rubric was developed in the aforementioned previous exam development project (PSI, February 2010).

## **2. Item Review and Evaluation**

LLU staff convened separate panels of subject matter experts to review and formally evaluate the items for each oral exam language. The expert panels evaluated each item with respect to relevance to occupational requirements, the need for competence upon certification and estimated difficulty for initial certification candidates.

The panelists' qualifications appear in Appendix A. In the table within the appendix, there are columns indicating in which phase of test development they participated in (i.e., item writing, item review, standard setting). The participants were selected primarily on the basis of experience and involvement in the industry, as well as familiarity with test administration.

The item review process included training sessions for the subject matter experts, covering PSI's *Item Reviewing and Writing Principles* and modified Angoff rating process. After training, the advisory panel, members reviewed and formally rated the test items. The panel members provided Angoff ratings twice – first without the answer key, and then again after having seen the answer key.

As part of training, the expert panel was calibrated on how to define a "Minimally Acceptable Candidate" at the time of certification on which to base their item review ratings, using the following standard:

- An individual who possesses the minimum knowledge, skills and ability to practice without endangering the public
- NOT an individual who is unacceptable
- NOT all test-takers, since some are unacceptable (those who fail) and some are acceptable (those who pass)
- NOT an individual you would hire to work for you, since he or she is typically beyond minimally acceptable
- NOT all acceptable candidates, since some are minimally acceptable and some are beyond minimally acceptable
- NOT all graduates of a training program, since some are unacceptable, some are minimally acceptable, and some are beyond minimally acceptable

The panel was also educated on important item characteristics; i.e., an item should:

- Be relevant and important to the job tasks commonly performed and the job knowledge regularly used
- Be related to public protection and designed to eliminate those candidates who would pose a danger to the public
- Target a minimally acceptable candidate at time of certification
- Include the most current information available to all potential candidates
- Be phrased in the working language of the job
- Be realistic and practical
- Be at an appropriate reading level
- Be supported by a reference

Advisory panel members rated each item as follows:

1. Item Acceptable – Panelists were asked, "Is this item acceptable for use on the certification exam?" by selecting "Yes" (1), "No" (2), or "OK as edited" (3).
2. Relevance – Panelists were asked, "How relevant is this item to overall competent performance of a medical interpreter's job?" Response options were: "Of no importance" (1), "Of little importance" (2), "Moderately important" (3), "Very important" (4), and "Critical" (5).
3. Difficulty – Panelists participated in a modified Angoff procedure (described below) to identify the percentage of candidates, at initial time of certification, who would answer the question correctly.

Advisory panel members rated both Consecutive and Sight utterances (elements) of the oral exams. On the Consecutive portion, each utterance contains two scoring units, and on the Sight Translation portion, each segment includes 3-4 scoring units. The Angoff rating was completed on the basis of the entire utterance/segment based on the rationale that all the scoring units in each utterance/segment are critical to rating the acceptability, relevance and difficulty of the given segment.

In order to ensure SME rating calibration and consistency, workshop facilitators reviewed in detail each of the above three ratings, providing further clarity and allowing time to answer any questions from the panel members.

### **1. Item Acceptable Rating**

Consider the following item characteristics when completing the “acceptability” rating:

- Correctness of the key
- Incorrectness of the distractors
- Correctness of the terminology
- Applicability to the field

Use the following process to rate the acceptability of each item:

- When reviewing an item independently, check either the "Yes" or the "No" box.
- When the group discusses an item that one or more reviewers found unacceptable, the item may be revised to make it acceptable.
- If the revision makes the item acceptable in your opinion, check the "OK as Edited" box.

### **2. Relevance**

How relevant is this item to minimally acceptable performance by an entry-level licensee?

<b>0</b>	<b>1</b>	<b>2</b>	<b>3</b>	<b>4</b>
Of <b>no</b> relevance	Of <b>little</b> relevance	Moderately relevant	Very relevant	Extremely relevant

### **3. Difficulty/Standard Setting**

Use the following process to rate the difficulty of each item:

- Think of 100 individuals that are EXACTLY minimally acceptable
- Remember that these 100 minimally acceptable candidates will have differing strengths and weaknesses
- Rate the percentage of these 100 minimally acceptable candidates that would respond correctly to the item
- Base the rating on the difficulty of the concept tested and the alternatives presented
- Use a starting point of 25%, since 25% will respond correctly to the item by chance given four alternatives
- Use increments of 5%
- Do NOT write a % sign

Additional materials used to facilitate the item review workshops can be found in a separate technical report (PSI, June 2012).

Following the workshops, PSI analyzed the SME's Item acceptability, Angoff, and Relevance ratings. Item acceptability was calculated by examining the percentage of raters who rated an item "Acceptable" for those items that did not need to be modified or "OK as Edited" for those items that were modified in order to be acceptable. An item was considered acceptable if 60% or more of the raters deemed it so. Item relevance and item competence ratings were evaluated to determine which items were appropriate for the exam. If an item had a mean relevance 3 or higher, the item was retained for use in the item pool.

### **3. Pilot Testing**

Experimental forms of each oral language exam were assembled and pilot tested. LLU selected and trained raters to evaluate examinee performance on the oral exam, and then conducted pilot testing sessions with the oral exam. PSI analyzed the test item response data to cast equivalent alternate forms of the oral examination. Further details regarding the methodology are described below.

#### **Experimental Test Forms**

PSI worked with LLU to assemble two experimental forms of each of the five language oral examinations, including the scenarios and instructions. Each exam form was comprised of two parts, including sight interpretation (6 segments and 30 scoring units) and consecutive interpretation (15 scenarios and 180 scoring units), for a total of approximately 21 test items and 210 scoring units per form.

#### **Rater Selection, Training, and Calibration**

**Selection.** LLU conducted a rigorous process for the selection and training of medical interpretation experts to serve as raters to score the oral exams. The process incorporated input from higher institutions of learning, such as the Monterey Institute of International Studies, and healthcare organizations and professional associations, to form a pool of potential raters to be used in the pilot testing process. The recommendations and resumes of candidates for this role were meticulously reviewed and only the most qualified candidates were then invited for an interview. The interview process gleaned additional information regarding each candidate and their background, education, and experience in the field, as well as other important elements in rater qualification, such as demeanor, pronunciation and enunciation, and tone of voice. It also provided the Project Manager with a perspective on other factors related to successful testing and rating that cannot be quantitatively measured, such as the ability to work as a team, attitude towards coaching, and the desire to grow professionally. The candidates chosen for this role met the highest standards in all of the aforementioned areas and also met the following criteria:

##### **Required**

- At least 5 years of experience working as a medical interpreter
- Completion of at least 40 hours of medical interpreter training
- An advanced degree in a language, interpreting and translating, linguistics, language pedagogy, medicine or medical specialties
- At least 1 professional reference

##### **Preferred**

- Prior experience in testing, test development and/or test rating
- Excellent on-the-job performance ratings

- Certificates of Completion, professional certification documents
- Other interpreting experiences

### Rater Profile

The following is a sample profile of a typical Rater:

- M.A., Magna Cum Laude
- University-level Instructor
- 10 years of experience as a medical interpreter
- Free-lance translator
- State Certified Court Interpreter

**Training and Calibration.** Once the raters were selected, intensive training was conducted by Language Line Academy, based on its 30 years of experience in the development and rating of interpreter skills assessments. The training included practice with test delivery, as well as calibration sessions in which the scoring rubric (displayed in Appendix B) was applied to evaluate sample exams and the results were reviewed and discussed. The scoring rubric is comprised of a methodology that includes both subjective and objective elements to capture the entire skill set needed to qualify as a certified medical interpreter. Each of the scenarios on the examination included units that are scored on the following factors: linguistic equivalence, conservation of register, grammatical correctness, and pronunciation. There is also a holistic rating, which applies to the entire segment. Within each of these factors, there are detailed performance elements that are described in the scoring rubric. Furthermore, instruction was also provided in the proper management of responses not included in the scoring rubric, which entails review by the test design team. The purpose of the training was to ensure that the raters shared a common understanding of each rating element and the standards by which performance would be evaluated. The pilot testing phase only began once the raters had reached a level of consistency through calibration exercises, as well as quality in the delivery of the exam.

Materials used in the Rater Training included all test versions, rating forms, test results, report forms, scoring rubric (dictionary), and a detailed description of the rating protocol.

The Rater Training consisted of:

- Detailed review of test rationale and content
- Extensive instruction in Rating Protocol and Procedures
- Discussion of items in Scoring Dictionary and process for adding new items to dictionary
- Use of Rating Form and Test Results Report

The training also involved intensive calibration exercises, as follows:

- Reviewing pilot test scores, item-by-item, to gain a greater understanding of rating process
- Listening to pilot tests and rating them, until all Raters have consistent scores and all discrepancies and doubts are resolved
  - As a group first
  - Individually
- Filling out Rating Forms using the Scoring Dictionary

- Comparing Rating Forms as a group
- Test role-plays designed to present challenges for rating
  - All Raters rate the test role-plays and discuss rating

The Project Manager and Lead Tester continued all of the above exercises until the Rater was deemed to be adequately prepared to rate a test on their own, based on consistency, understanding of rating protocol, pace of rating, and correct documentation of scores.

All tests rated by a new Rater were reviewed by the Lead Tester to identify any rating issues and return to any of the steps above to resolve those issues. A new Rater was not assigned to rate a test on his/her own until the Project Manager and Lead Tester were satisfied that they had a complete understanding of the rating protocol and process. For the first two weeks, all tests rated by a new Rater were reviewed in detail by the Lead Tester.

The same raters who participated in the pilot study also serve as raters for the operational testing program. Future training of any new Raters who are selected will include 40 hours of training with the Project Manager and Test Developers, and will encompass all of the same elements described above.

### **Rating Protocol**

The scoring rubric (see Appendix B) was developed in the 2010 exam development study, cited earlier. The rubric was designed to be highly detailed and specific with respect to performance behaviors such that the raters have a common frame of reference in evaluating candidate performance. To this end, the scoring rubric presents evaluation factors and detailed performance elements.

The Rating Protocol for the National Board Test was established by Language Line Academy's team of Subject Matter Experts in stages, as follows:

- Research and review of alternate rating protocols for interpreter tests
- Input from psychometrician re. the rationale for a rating protocol
- Preparation of initial draft of rating protocol
- Further discussion and modification of rating protocol

The Rating Protocol, or scoring rubric, is comprised of a methodology that includes both objective (scoring unit methodology) and holistic rating elements to capture the entire skill set needed to qualify as a certified medical interpreter. Each of the scenarios on the examination includes units that are scored on the following factors: linguistic equivalence, conservation of register, grammatical correctness, and pronunciation. The rationale for this protocol was based on the belief that a rating methodology based solely on the objective methodology of scoring units does not ensure a comprehensive assessment of an interpreter's skill and knowledge, given that interpreting involves conveying complete and accurate meaning, and not only accurate terms. The inclusion of the more comprehensive or holistic rating ensures that other elements, besides knowledge of terminology and language, are also measured by the test.

To ensure the utmost consistency, the Raters of the National Board oral exam utilize a Scoring Dictionary developed by the Test Designers, according to the process described below.

## **Scoring Dictionary**

The initial version of the Scoring Dictionary was developed by the Test Developers, who conducted an extensive review of all scoring units on the test and possible responses, and came to a consensus about response scoring weights. The Scoring Dictionary serves as a means of ensuring the objectivity of the rating in that all Raters refer to the Scoring Dictionary as their sole reference when assigning a point value to each term provided by the test candidate. It also ensures inter-rater reliability and consistency, since a term that is not in the Scoring Dictionary must be researched and agreed upon by a panel, according to the following process for awarding a point value. Furthermore, rating consistency is further enhanced by the fact that there are so few raters per language to date.

Whenever a term comes up that is not in the Scoring Dictionary, it is submitted by the Rater to the Expert Panel, comprised of the Lead Tester and other members of the Test Design Team. The term is not awarded any point value until the Expert Panel has rendered an informed decision about the acceptability of the term.

To summarize, the Scoring Dictionary is maintained in an ongoing manner according to the following process:

- A new item given by a test candidate that is not found in the Scoring Dictionary is submitted by the Rater to the Expert Panel for research and review;
- The Expert Panel comes to a consensus regarding the point value of the new test item;
- The Rater is informed of the point value and applies it accordingly to the rating of the test in which it appeared;
- The Lead Tester adds the new term and its corresponding point value to the Scoring Dictionary;
- The Lead Tester provides an updated Scoring Dictionary to all Raters.

The use of the Scoring Dictionary ensures utmost consistency, as individual Raters do not rely on their personal judgment at the moment to award value points, but rather, they go by what has been provided in the Scoring Dictionary.

Once the Rater completes the scoring of an individual test, it is submitted to the Lead Rater for review. The Lead Tester reviews the Score Sheet and Test Results, and also listens to the recording of the test as appropriate. Once this review has been completed, the scored test results are submitted to the Project Leader, who is also a qualified Rater, for a final review. Only when both the Lead Tester and Project Leader are satisfied that the test has been rated appropriately, according to the Rating Protocol, are the results emailed to the National Board.

The National Board subsequently provides the test candidate with the results of their test and prepares a Certificate for candidates who have obtained a passing score.

## **Pilot Administration**

LLU conducted a targeted recruitment of medical interpreters to complete one of the experimental oral exams for the pilot study. Pilot participants came from all regions of the country and included representation from colleges and universities, healthcare institutions, professional interpreter associations, and included free-lance professional interpreters, staff interpreters and dual-role interpreters. A proctor was identified at each testing location and provided with detailed instruction in the confidential test delivery process. This element represented a means of ensuring test security and, ultimately, valid test results.

In light of the relatively limited number of medical interpreters practicing in the five languages (Russian, Mandarin, Cantonese, Korean, and Vietnamese), pilot testing samples were comprised of approximately 30 medical interpreters per experimental Form A and Form B, per language.

### **Scoring**

As noted above (see Training and Calibration), evaluators were selected and trained to apply the scoring rubric to score the pilot examinees. For a subset of participants in the pilot study, two raters completed the scoring rubric to enable calculation of reliability statistics for the oral exam. LLU collected the oral exam ratings and created a data file for analysis by PSI. PSI conducted preliminary edit checks of the data file and worked with LLU to ensure that the data were accurate.

It should be noted that in the operational administration and scoring of the oral exams, the same pool of raters in the pilot study will be used in scoring the oral examinations. Moreover, all test results reports are reviewed at two different levels before they are provided to the candidate. The process for rating all tests is for the rater to submit his/her Score Sheet to the Lead Tester, who then reviews the Score Sheet in its entirety, and also listens to the recording of the test, as appropriate, if there are any questions about a term and its rating. Once this review has been completed, the Score Sheet and Test Results Report are submitted to the Project Leader, who is also a qualified rater, for a final review. Only when both parties are ensured that the test has been rated appropriately, according to the rating protocol, are the results emailed to the National Board. This is a two-level review process that ensures the quality and consistency of all test ratings.

### **Results**

Statistical analyses of the experimental forms were conducted, which are summarized in Table 1, including the number of examinees completing the form (N), number of item scoring units, mean rating, standard deviation (SD), Cronbach's alpha coefficient of internal consistency reliability, mean relevance rating, the mean Angoff rating, and the inter-rater correlation index of rating reliability for a subset of examinees (Russian: N=22; Mandarin: N=28; Cantonese: N=31; Korean: N=30; Vietnamese: N=30); all total score alphas were observed to be .93 or higher across all forms of all five language exams.

**Inter-rater Reliability Estimate.** The inter-rater reliability coefficient is the correlation between pairs of raters who applied the scoring rubric to evaluate a subset of examinees. These raters are similar in professional experience to the full set of raters and they received the same training and followed the same standard rating procedures. Thus, it is reasonable to expect that the sample of raters is representative of the rater population who apply the same scoring rubric and receive the same training. The high level of agreement can be attributed to rater calibration training and to sound item characteristics. The scoring rubric was found to be highly reliable, as evidenced by the inter-rater reliability coefficients ranging from .87 to .99, thus reflecting the high quality and effectiveness of the rater training. Because the oral exam is manually scored by raters who apply the scoring rubric, the inter-rater reliability index is useful in describing the degree of measurement precision (freedom from rater error) that can be expected. The reported inter-rater reliability is a strong indication of uniformity among raters. This reliability can be assumed by other exam forms due to the exam form equivalency. The exam form characteristics

(mean, SD, reliability, avg. Angoff, avg. Relevance) are parallel across the three forms and this supports the generalization of the rater reliability to these parallel forms.

**Table 1: Oral Exam Pilot Form Descriptive Statistics**

<i>Russian Pilot Examination Forms</i>								
	N	# Scenarios / # Scoring Units	Mean	SD	Cronbach's Alpha	Mean Relevance Rating	Mean Angoff Rating	Rater Correlation (N=22)
<b>Form A</b>								
Sight	30	6 / 30	41.5	6.63	0.78	3.79	71.92	0.91
Consecutive	30	15 / 180	213.98	29.65	0.94	3.74	80.5	0.87
Total	30	21 / 210	255.48	33.99	0.94	3.75	79.5	0.88
<b>Form B</b>								
Sight	32	6 / 30	41.63	6.49	0.75	3.79	67.54	
Consecutive	32	15 / 180	207.75	30.58	0.93	3.88	78.59	
Total	32	21 / 210	249.38	33.61	0.93	3.87	77.29	
<i>Mandarin Pilot Examination Forms</i>								
	N	# Scenarios / # Scoring Units	Mean	SD	Cronbach's Alpha	Mean Relevance Rating	Mean Angoff Rating	Rater Correlation (N=28)
<b>Form A</b>								
Sight	31	6 / 30	46.23	5.96	0.8	3.99	82.89	0.95
Consecutive	31	15 / 180	244.44	27.16	0.94	3.76	82.89	0.92
Total	31	21 / 210	290.66	30.64	0.94	3.78	82.89	0.96
<b>Form B</b>								
Sight	32	6 / 30	46	6.34	0.76	3.98	74.35	
Consecutive	32	15 / 180	246	24.78	0.92	3.79	81.84	
Total	32	21 / 210	292	29.61	0.93	3.81	80.96	
<i>Cantonese Pilot Examination Forms</i>								
	N	# Scenarios / # Scoring Units	Mean	SD	Cronbach's Alpha	Mean Relevance Rating	Mean Angoff Rating	Rater Correlation (N=31)

#### 4. Test Form Assembly

The test item statistics were reviewed and served as a basis for assembling three alternate oral exam forms (A, B, and C) for each of the five languages that are all representative of the content outline and statistically equivalent (i.e., comparable in mean, SD, and reliability), meeting conventional standards of equivalence (e.g. Allen & Yen, 1978). The item-level statistics for the items comprising each new test form are shown in Appendix C.

Statistical properties of the resulting oral examination Forms A-C are summarized in Table 2. These new forms were comprised of a combination of items from the experimental Forms A and B. Item selection for each new exam form was based on content and statistical equivalence, as well as the mean Angoff rating. Also, the inter-rater reliability ratings for Form A were taken into consideration, because two raters scored the items on this form. Furthermore, the new test forms were cast shorter than the experimental versions to reduce testing time and the potential for test fatigue. The consecutive/oral section was reduced from 15 to 12 scenarios.

**Table 2: Statistical Properties of Final Oral Examination Forms for Five Languages**

## 5. Recommended Minimum Passing Scores

Empirical examinee data were balanced with modified Angoff ratings to establish recommended passing scores, or cut scores, for the five language oral examinations. In addition, language experts were consulted to explain similarities and differences in the difficulty of interpreting in different languages.

The Angoff method is a widely accepted and researched method for standard-setting, and has accumulated considerable empirical evidence to support its validity (Hurtz & Auerbach, 2003). In this process, experts were asked to rate the percentage of candidates (at the time of initial certification) who would successfully answer each item on the examination. After each expert completed these ratings, mean ratings were determined for each item. These mean ratings were aggregated to determine the cut score for a specific examination, based upon the items included on the exam.

PSI psychometric staff conducted statistical analyses of the Angoff ratings for the oral item ratings provided by the committee members during the SME review meeting described earlier in

this report in section 2.3. Ratings were averaged across all raters who provided data for an item. Full item Angoff and Relevance ratings for the oral exam are shown in Appendix D, and are summarized in Table 2 for each language exam by form and section.

Results and recommendations for each language exam are summarized below.

### **Russian**

Pilot exam descriptive statistics (Mean, Standard Deviation, and Cronbach's Alpha) were reviewed in conjunction with SME's Angoff ratings of the items selected to comprise the Russian oral exam forms. Balancing these two factors, a cut score of 70% was recommended, which was consistent with the previously developed oral certification exam for Spanish interpreters (see *Development and Validation of Oral and Written Examinations for Medical Interpreter Certification Technical Report, April 2010*). While the average Angoff ratings were higher than 70 on the Russian exam, the empirical results were comparable to the Spanish forms and thus given more weight than the SME judgments in identifying a recommended cut score that would be consistent with established standards.

### **Mandarin**

Pilot study participants performed considerably higher on the sight and consecutive portions of the Mandarin oral examination form in comparison to the Russian and Spanish forms. This result was consistent with higher Angoff ratings for the Mandarin items, indicating that SMEs thought the exam was easier in the Mandarin language. It is hypothesized that the higher pilot scores and Angoff ratings for the Mandarin oral exam may be due to inherent characteristics of the language, which may offer fewer "wrong choices." Because the Mandarin test form statistics and average Angoff ratings were consistently higher than the Russian and Spanish forms, a correspondingly higher cut score was recommended for the Mandarin oral exam forms. An overall cut score of 80% was established for the Mandarin medical interpreter certification oral examination.

### **Cantonese**

The Cantonese pilot exam participants scored substantially lower than the average Angoff ratings. In balancing the two sets of information, along with anecdotal information about the population of Cantonese medical interpreters, more weight was given to the empirical results and a cut score of 70% was recommended, consistent with the Spanish and Russian exams, which had similar empirical results.

### **Korean**

The Korean pilot exam participants, similar to the Cantonese pilot study, scored substantially lower than the average Angoff ratings. In balancing the two sets of information, along with anecdotal information about the population of Korean medical interpreters, more weight was given to the empirical results and a cut score of 70% was recommended, consistent with the Spanish, Russian and Cantonese exam, which had similar empirical results.

### **Vietnamese**

The Vietnamese pilot exam participants performed substantially lower than examinees on the other language exams, with a total score average of 57% correct. The Angoff ratings were somewhat higher (ranging from 78 to 82) and thus, in balancing the two sets of data, a cut score of 65% was recommended.

## **Ongoing Review Process**

This section describes the testing program practices that are planned for the five language interpreter oral exams after they are implemented.

### **Rater Calibration**

The ongoing quality and consistency of the rating process is of the utmost importance to the National Board. Any minor rating anomalies noted by the Lead Rater during her regular review of test results are identified and resolved immediately before the Rater continues to rate any tests. Additionally, annual calibration exercises are conducted with all Raters who are actively rating National Board Tests. All calibration exercises conducted with the Raters indicate that they are highly consistent and well-calibrated. Their accuracy is at the same level as identified during the initial inter-rater reliability study, as described in the 2010 technical report (*Development and Validation of Oral and Written Examinations for Medical Interpreter Certification Technical Report, April 2010*). These annual calibration sessions will consist of the following:

- Review of updated Scoring Rubric (Dictionary)
- Calibration sessions with sample of recorded tests
- Discussion of any test-related issues that may surface

### **Exam Review**

Exam and item analysis reports (technical reports) will be prepared by PSI annually in the first quarter of each year to provide statistical and diagnostic summaries for each test item and exam form, where feasible. Each exam item will be monitored to ensure effectiveness through the life of the item.

The item analysis will address common parameters, such as difficulty, discrimination (point-biserial correlation) and distractor effectiveness (percentage of respondents in conjunction with point-biserial correlation). These results, in conjunction with item exposure rates, will be examined to develop a plan for new content development. The aim of the plan will be to introduce at least 1/3 fresh content per year, with item exposure of 100 to 500 examinees, and acceptable item statistics (significant positive total point-biserials; negative distractor-total correlations, etc.).

The exam analyses will address common parameters, such as item difficulty, discrimination (point-biserial correlation) and distractor effectiveness. In addition, it will include a calculation of the exam mean, SD, internal consistency reliability, and pass rates. For the oral exam forms, an analysis of inter-rater reliability will be conducted by drawing a 10% sample of candidate exams, a minimum of 10 per exam form A, B, and C (a total of at least 30 candidates). For this sample, a second trained and qualified rater will independently evaluate the candidates' recorded oral responses to the oral certification exam. These second scores will be correlated with the candidates' original scores using the same methods described earlier to estimate the reliability of a single rater. This sample is expected to be sufficient with respect to standard error of the correlation.

Exam analysis results, in combination with item exposure rates, will be examined to develop a plan for new content development. The aim of the plan will be to introduce at least 1/3 fresh

content per year, with item exposure of 100-500 examinees, and acceptable item statistics (significant positive total point-biserials; negative distractor-total correlations, etc.).

PSI, LLU, and the National Board plan to continually monitor the performance of the written and oral exams each calendar year, as described above, and will continuously update the exams as needed to ensure that the items and exam forms are performing satisfactorily, and that new content is introduced to avoid over-exposure of the item content, all in a manner that is reasonable and consistent with the size and economics of the examination program.

## **Summary and Conclusion**

The Russian, Mandarin, Cantonese, Korean, and Vietnamese language medical interpreter certification oral examination development project was founded upon a national job analysis with representation across the US, including a wide range of medical interpreting settings. The exam content specifications incorporate knowledge domains that were identified in the national job analysis and which were reviewed by a panel of subject matter experts. These specifications served to guide test item development and examination construction. An extensive pilot test phase and rigorous psychometric analysis provided the basis for assembling statistically equivalent oral examination forms that meet psychometric criteria for reliability and content validity.

## **Appendix B. Scoring Rubric**

### **NMICT Oral Test Scoring Rubric**

#### **Consecutive Role-Play**

Each of the utterances or segments of the consecutive interpreting portion of the NMICT Oral Test will be rated according to the following scoring guidelines. NOTE: When the term “reference materials” is used, that includes the Scoring Dictionary.

#### **Scoring Unit Rating**

For each of the two identified scoring units in the utterance/segment, the test candidate will receive 2 points if the term used is

- cited in reference materials as a proper linguistic equivalent<sup>1</sup> for the term, with no deviations<sup>2</sup> from standard pronunciation<sup>3</sup>, no grammatical errors<sup>4</sup> and conservation of register.
- a synonym cited in reference materials as a proper linguistic equivalent for the term, with no deviations from standard pronunciation, no grammatical errors, and conservation of register.
- a word or phrase that accurately conveys the meaning of the term, as defined in reference materials, with no deviations from standard pronunciation, no grammatical errors, and conservation of register, (when a standard and proper linguistic equivalent does not exist in the target language).

For each of the two identified scoring units in the utterance/segment, the test candidate will receive 1 point if the term used is

- cited in reference materials as a linguistic equivalent for the term, with no deviations from standard pronunciation and no grammatical errors but without conserving register.
- cited in reference materials as a proper linguistic equivalent for the term, with no deviations from standard pronunciation, conservation of register, and no more than one grammatical error.
- a definition of the scoring unit's meaning cited in reference materials, with no deviations from standard pronunciation, no grammatical errors, and conservation of register when a standard and proper linguistic equivalent exists in the target language.
- cited in reference materials as a proper linguistic equivalent for the term, with no grammatical errors, conservation of register and more than one deviation from standard pronunciation.

For each of the two identified scoring units in the utterance/segment, the test candidate will receive 0 points if the term used is

---

<sup>1</sup> Regional variations that can also be verified in reference materials as being proper linguistic equivalents are also considered to be two-point answers.

<sup>2</sup> Deviations are defined as the following: omitting a phoneme, adding a phoneme or substituting one phoneme for another.

<sup>3</sup> Standard pronunciation is subject to regional variations, all of which will be considered acceptable, provided that the pronunciation is readily understood by speakers who are not from the same region.

<sup>4</sup> Grammatical errors are limited to gender agreement and plural/singular agreement among parts of the scoring unit only. Only grammatical errors forming part of the scoring unit shall be considered. Grammatical errors in other parts of the sentence will not be taken into account.

- omitted from the interpretation.
- cited in reference materials as a proper linguistic equivalent for the term, with two or more deviations from standard pronunciation.
- not cited in reference materials as the proper linguistic equivalent for the term.
- left in the source language.
- a definition of the scoring unit's meaning not cited in reference materials.
- cited in reference materials as a lower register linguistic equivalent for the term, with one or more deviations from standard pronunciation.
- cited in reference materials a lower register linguistic equivalent for the term, with one or more grammatical errors.
- a definition of the scoring unit's meaning cited in reference materials, with one or more deviations from standard pronunciation.
- a definition of the scoring unit's meaning cited in reference materials, with one or more grammatical errors.
- a false cognate.

### **Holistic Rating**

An additional 1 point will be awarded for each utterance/segment as long as none of the following errors are noted:

- Significant meaning change of the utterance
- Omission of a significant part of the utterance that causes a change in the outcome of the segment
- Significant additions or embellishments to the utterance
- Coining or invention of words that do not exist in reference materials
- Noticeably heavy accent/mumbling/incoherent speech that impedes understanding by the Examiner

A total of 6 repetitions of utterances/segments will be allowed during the entire test. Repetitions must be requested by using the appropriate protocol and the Examiner will repeat the entire utterance/segment.

Total possible points: 240

## **Sight Test**

The Sight Test will be scored according to the aforementioned rubric for the consecutive role-play, with the exception of the Holistic Rating.

### **Scoring Unit Rating**

Each Sight Test is comprised of 2 separate scripts, each of which have 12 scoring units, to be rated according to the 2-1-0 pt. Scoring Unit rubric described above.

### **Holistic Rating**

Each separate script has 3 paragraphs, each of which will receive a holistic rating, according to the 1-0 pt. Holistic Scoring rubric described above.

The total possible number of points that a candidate can receive for the Sight Test, therefore, will be 6 points, as follows:

24 scoring units X 2 possible points = 48 points  
6 paragraphs X 1 possible point = 6 points

**Total Number of Possible Points = 54**

## Appendix C. New Form Item Statistics
